For what size of home is the robot suitable?

Sara - 2023-08-25 - Get to know your robot

The robot can clean areas of up to 200 m² with a single map. The map takes into account the area resulting from the largest length and width of the floor space. For example, the actual living space is smaller for an L-shaped floor plan. If the living space is too large, part of the area can be partitioned off during the exploration and then the remaining part of the living space can be saved on a separate map by completing a second exploration.
